Abstract

The peak of the glory of Islam can be seen from the progress of the Abbasid Dynasty during the leadership of Harun Ar-Rasyid. Because of the rapid progress in all fields, this era was nicknamed as *The Golden Age* (Golden Age). This progress is seen in various fields ranging from education, economy and infrastructure, making the Abbasid Dynasty highly respected by other nations. Progress is also seen in the field of health and the development of medical science. The Abbasid Dynasty government focused on developing science so that Muslim scientists and Muslim doctors emerged whose knowledge influenced the world of medicine in the world. Starting from Ibn Sina and Ar-Razi who are very famous as the fathers of modern medicine. The purpose of writing this article is to find out the development and progress of the Abbasid Dynasty in the field of medicine and health. The process of making this article uses the (Library Research) method by collecting a number of books, magazines, journals and relevant sources as well as in-depth analysis. Medical science developed rapidly in the Abbasid era where medical figures and techniques emerged that were very influential for the development of medical science and technology today. Ibn Sina became a pioneer in the advancement of health and medical science he also wrote a book *At-Tibb Law* which is a reference for medical science throughout the world.

INTRODUCTION

The Abbasid Dynasty represents one of the most remarkable periods in Islamic history, often regarded as the peak of Muslim civilization in terms of intellectual, cultural, and political achievement. During this era, the advancement of knowledge and science far surpassed that of the contemporary Western world, placing the Islamic world at the center of global intellectual activity. The establishment of the Abbasid Caliphate was initiated by Abū al-‘Abbās ‘Abd Allāh bin Muḥammad al-Saffāh (721–754 AD) and further consolidated by Abu Ja‘far Abdullah bin Muhammad Al-Mansur (714–775 AD).

Their leadership laid a strong political and administrative foundation that enabled future development. The dynasty continued to flourish under subsequent rulers, reaching a notable phase of brilliance during the reign of the third caliph, Muhammad bin Mansur al-Mahdi (744–785 AD), and later under the ninth caliph, Abū Ja‘far Hārūn bin Muḥammad al-Watsiq billah (812–847 AD). These periods were characterized by stability, expansion, and intellectual curiosity. The combination of strong governance and a commitment to knowledge created a fertile environment for scientific growth. Scholars from various regions were encouraged to contribute to the expanding body of knowledge. This era also saw the translation of many classical works into Arabic, enriching Islamic scholarship. As a result, the Abbasid Dynasty became synonymous with intellectual excellence and cultural sophistication (Artsi et al., 2025; Vohra et al., 2025; Zhao et al., 2025).

The pinnacle of Abbasid glory is most often associated with the reign of Caliph Harun al-Rashid (786–809 AD) and his son, al-Ma'mun, whose leadership marked an extraordinary period of advancement. Under their rule, the empire experienced rapid progress across multiple domains, including politics, healthcare, science, and military development. Their governance emphasized not only expansion and administration but also the nurturing of intellectual life. Institutions dedicated to learning, such as libraries and centers of translation, were established and supported by the state.

This period also witnessed increased interaction between different cultures and civilizations, facilitating the exchange of ideas. The translation movement, in particular, played a crucial role in preserving and expanding knowledge from Greek, Persian, and Indian sources. Harun al-Rashid’s court became a hub for scholars, thinkers, and innovators. His policies promoted intellectual engagement and scholarly debate. Meanwhile, al-Ma'mun further strengthened these initiatives by institutionalizing scientific inquiry. Together, their leadership ensured that knowledge became a central pillar of governance. This commitment ultimately propelled the Abbasid Dynasty to unparalleled heights in global history.

The widespread recognition and popularity of the Abbasid Dynasty reached its zenith during the time of Caliph Harun al-Rashid and his successor, al-Ma'mun (813–833 AD). During this era, particular emphasis was placed on the development of education and scientific disciplines as key drivers of societal progress. The rulers believed that intellectual advancement was essential for strengthening the state and enhancing civilization. As a result, they invested heavily in educational institutions, scholarly activities, and scientific exploration. The establishment of centers of learning created opportunities for scholars to conduct research and share knowledge.

This environment fostered a culture of inquiry and innovation that significantly contributed to the advancement of various fields. Educational reforms were implemented to ensure the dissemination of knowledge throughout the empire. Scholars were given patronage

and resources to pursue their intellectual endeavors. The emphasis on education also encouraged the emergence of a learned society. This period became a model for integrating knowledge with governance. Consequently, the Abbasid Dynasty gained widespread admiration and influence across different regions (Daulay et al., 2020).

One of the most significant outcomes of this intellectual flourishing was the emergence of prominent Muslim scholars who made groundbreaking contributions to science and knowledge. Among these figures was Al-Khwarizmi, who is widely recognized for his pioneering work in algebra, a field that continues to influence modern mathematics. In addition to mathematics, scholars during this period made remarkable advancements in chemistry, medicine, astronomy, and philosophy. Their work not only expanded theoretical knowledge but also provided practical applications that benefited society.

The integration of different fields of study allowed for a holistic approach to learning and innovation. Many of these scholars built upon earlier knowledge while also introducing new ideas and methodologies. Their contributions were systematically documented and preserved, ensuring their transmission to future generations. The Abbasid intellectual tradition emphasized critical thinking, experimentation, and observation. This approach laid the groundwork for scientific methods that are still relevant today. The achievements of these scholars highlight the importance of intellectual freedom and state support in advancing knowledge (Ali et al., 2025; Fakharifar et al., 2025; Will et al., 2025).

In conclusion, the Abbasid Dynasty stands as a golden age in Islamic history, characterized by extraordinary achievements in governance, education, and scientific development. The strong leadership of its caliphs, particularly Harun al-Rashid and al-Ma'mun, played a crucial role in fostering an environment conducive to intellectual growth. Their commitment to education and knowledge transformed the Abbasid Empire into a global center of learning and innovation. The advancements made during this period not only influenced the Islamic world but also contributed significantly to the development of global civilization.

The legacy of Abbasid scholarship continues to be recognized in various modern scientific disciplines. The integration of diverse knowledge systems demonstrated the value of cross-cultural collaboration. This historical period serves as an important example of how intellectual investment can lead to societal progress. It also highlights the role of leadership in shaping the direction of civilization. The Abbasid experience underscores the enduring importance of education and research. Ultimately, the dynasty's contributions remain a testament to the transformative power of knowledge and innovation in human history.

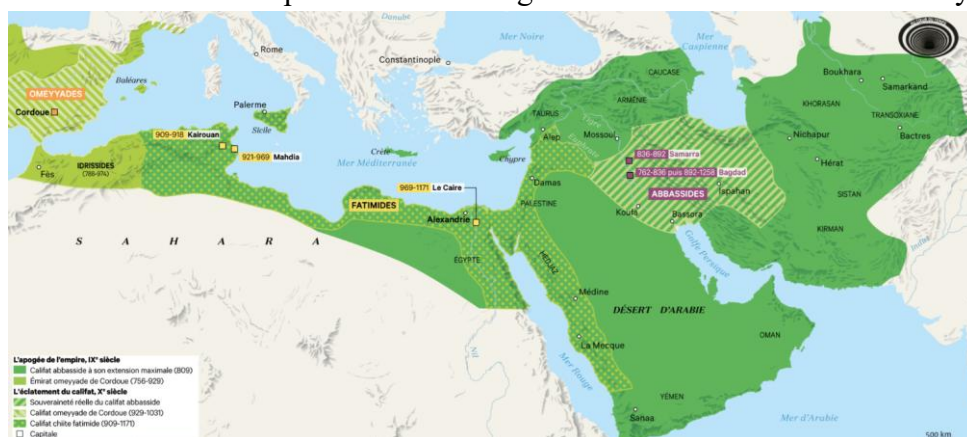

Figure 1. Map of the Abbasid Dynasty in its Golden Age

One of the driving forces behind the success of scientific progress during the Abbasid Dynasty was the translation of foreign literature into Arabic. This activity was pioneered by Abu Ja'far Al-Mansur (Boozaripour et al., 2025; “Correction to: Systemic Immune-Inflammation Index and Systemic Inflammation Response Index Predict the Response to Radioiodine Therapy for Differentiated Thyroid Cancer(Journal of Inflammation Research, (2024), 17, (8531-8541), 10.2147/JIR.S493397),” 2025; Rexy & Priya, 2025). He was the first caliph to translate foreign language literature into Arabic such as the works of Aristotle, the book Sanad India and various other literatures. Abu Ja'far Al-Mansur was the person who pioneered astronomical activities and established the kingdom's work activities based on astronomical laws.

Baitul Hikmah has become a world library by storing thousands of foreign literatures of Roman, Greek, Persian and Indian which were then translated into Arabic. This progress was followed by the birth of thousands of great scholars and writers (Chockalingam et al., 2025; Fazlali et al., 2025; Heidarzadeh et al., 2025). Baghdad has become the center of world civilization and a destination for scientists and seekers of knowledge from all over the country. Baghdad's progress later invited European nations to learn from Muslim scientists.I.

RESEARCH METHOD

This study employs a historical research approach to explore and analyze past events, developments, and contexts relevant to the topic under investigation. Historical research focuses on systematically collecting, evaluating, and interpreting data from previous records to gain a deeper understanding of phenomena over time. To support this approach, the study utilizes a library research method, which involves gathering information from various documented sources. These sources include printed books, electronic books, scholarly journal articles, research reports, and other credible academic publications. The use of diverse and authoritative literature enables the researcher to construct a comprehensive and well-grounded analysis (Gao et al., 2025; Kavosi et al., 2025; Lee et al., 2025).

Research Design

The research design adopted in this study is qualitative in nature, specifically rooted in historical inquiry. This design emphasizes critical examination and interpretation of documented evidence to reconstruct past events and understand their implications in the present context. The study systematically reviews and synthesizes relevant literature, ensuring that the analysis remains coherent and aligned with the research objectives. By applying a structured historical method, the research seeks to produce an in-depth and contextualized understanding of the subject matter.

Research Target/Subject

The primary focus of this research is not on human participants but on documented sources that contain relevant historical information. These sources include academic publications, archival materials, books, and validated digital resources. The selection of these materials is based on their relevance to the research topic, their academic credibility, and the accuracy of the information they provide. By carefully choosing appropriate sources, the study ensures that the data used reflects reliable and meaningful insights into the issue being examined.

Research Procedure

The research procedure begins with identifying and collecting relevant literature through systematic searches in academic databases and libraries. After gathering the sources, the researcher conducts a thorough screening process to determine their relevance and reliability. Selected materials are then organized and categorized based on thematic relevance. Following this, the researcher critically reviews and interprets the data, drawing connections between different sources to build a coherent narrative and analytical framework. This step-by-step process ensures that the findings are grounded in well-documented evidence.

Instruments and Data Collection Techniques

The main instrument in this study is the researcher, who plays a central role in identifying, selecting, and interpreting relevant data. Data collection is conducted through library research techniques, which involve reviewing and analyzing various forms of literature such as books, journal articles, e-books, and research reports. The researcher applies analytical skills to extract meaningful information from these sources, ensuring that the collected data aligns with the research objectives. This method allows for a comprehensive and in-depth exploration of the topic using existing knowledge (Gao et al., 2025; Kavosi et al., 2025; Lee et al., 2025).

Data Analysis Technique

The data analysis in this study is carried out using qualitative analysis techniques, particularly through critical interpretation and synthesis of the collected literature. The researcher evaluates each source based on its relevance, accuracy, and credibility, ensuring that only valid and reliable information is included in the analysis. The process involves comparing different perspectives, identifying key themes, and integrating findings into a cohesive discussion. Careful and systematic analysis is conducted to ensure that the conclusions drawn are well-supported by evidence (Chua et al., 2025; Novin et al., 2025). Additionally, the literature review approach enhances the researcher's understanding of the topic and provides a strong theoretical foundation for further investigation.

RESULTS AND DISCUSSION

During the leadership Caliph Hisham bin Abdul Malik started a movement to fight the Umayyad Dynasty in Andalusia. The change of non-Arab society to Arab is known from the leadership pattern. This can be seen from the lack of involvement of the Mawali and the nations that were controlled were given fines. Not only that, non-Muslims who lived in Islamic countries were also taxed and the government did not involve the Mawali and Shiites. This movement was initiated by Muhammad bin Ali, and he made the city of Kufa the new center of government.

Muhammad bin Ali's movement received support from the Mawali group, because the Mawali group was always placed as a second-class society. In addition, this resistance also received support from the Shiites who had not been friendly with the Umayyad Dynasty. The death of Marwan bin Muhammad in Fustat, Egypt in 132 H/705 AD marked the end of the Umayyad Dynasty's leadership and thus the establishment of the Abbasid Dynasty.

The Abbasid dynasty is proof of the glory of the Islamic Ummah in the past. No other nation or dynasty could match the progress of civilization and science of the Abbasid dynasty. It could be said that this era was the golden age for Muslims. So it is called (the Golden Age) or golden age (Amalia, 2022). The Abbasid Daulah had a big impact on the progress of

science, giving rise to prominent figures of Muslim scientists. The progress of the Abbasid dynasty became an inspiration for Europeans in developing their science. Many of the relics of the Abbasid Daula are silent witnesses to the triumph of Islam in the Middle East, Asia and Europe for 300 years.

The Abbasid Daulah was founded by Abul Abbas As-Saffah who was assisted by a Muslim commander who came from Khurasan, namely Abu Muslim Al-Khurasani. Not only that, he was also assisted by Abu Ja'far Al Manshur (754-775 AD) who was instrumental in building the Abbasid dynasty. This Daulah was called the Abbasid Dynasty because the initiators and rulers of the Abbasid Daulah were descendants of Abbas, the Prophet Muhammad's uncle (Fadhillah, 2019).

At first the center of the Abbasid Dinasti government was in Al-Anbar (Al-Hasyimiyah), after some time the center of government and the capital was moved to Baghdad. Islam developed greatly during this period. During the time of the Caliph Al-Mahdi, there was a very large expansion of territory. The daulah controlled by the Umayyad dynasty was also controlled by the Abbasid dynasty, the Arabian Peninsula, Africa and parts of Asia to the border of West China.

Advances in Health Science in the Abbasid Era

The support given by the caliphs became an important factor in medical progress during the Abbasid era. These caliphs upheld science and had a high curiosity about science. So that the development of infrastructure for education was prioritized (Oktaviyani, 2018). The emergence of centers of knowledge, especially Baitul Hikmah, became the gateway to the advancement of philosophy, Mathematics, Physics, Astronomy, and military in the era of Caliph al-Makmum of the Abbasid Dynasty (Kawakip, 2016; Rosyidi, 2016). Baitul Hikmah functioned as a center for scholars in various sciences, including medicine (health sciences). Imam Muhammad bin Zakaria Ar-Razi (Death 313 H) became a pioneer for changes in more advanced and developing medical science. Mr. Ar-Razi is often referred to as Islamic medicine (Maryam, 2011). Al-Hawi became an important reference for medical science and to this day Al-Hawi is still used. The financial and political support of the Abbasid rulers was an important factor in the ease of translation of Greek and Persian medical texts into Arabic. This translation enriches medical literature which is used as a reference in the medical world.

Another important figure in the development and advancement of medicine during the Abbasid period was Ibn Sina (Death 1037 AD), also known in the West as Avicenna. His famous book, al-Qanun fi al-Tibb (Canon of Medicine), became the main reference in medicine throughout the Islamic world and Europe for centuries (Nurkholiza et al., 2024). In this important work, Ibn Sina discussed a variety of medical topics, including disease diagnosis, pharmacology, and surgical practice. The scientific methodology he used in the field of medicine illustrates that the discipline goes beyond traditional practices, and also integrates logistical scientific principles (Hemdi, 2019; Amiruddin, 2024). This shows that Ibn Sina, along with his contemporaries in the Abbasid era, had developed a more sophisticated understanding of medicine than was found in the previous period. Therefore, Ibn Sina has the nickname Father of Modern Medicine.

The Abbasid era witnessed significant progress in the establishment of hospitals, known as bimaristan (Abbasids, 2020). These institutions served not only as facilities for patient care but also as important centers for medical education and research. The apprenticeship system was instituted by physicians in bimaristans, allowing medical students to hone their clinical

skills under the guidance of experienced physicians. Furthermore, during this period, hospitals offered free healthcare to the general public, a concept that was highly progressive for its time. The model set by these hospitals later influenced the development of healthcare facilities in Europe, which adopted many of the principles originally implemented in the Abbasid bimaristans.

In addition, the field of pharmacy also experienced rapid development during the Abbasid era. Researchers began to discover, group, and create various types of drugs from natural sources, such as plants, minerals, and animals. The increasingly advanced field of pharmacology helped doctors in creating more efficient drug formulations. In the bimaristan, there were special pharmacists who were tasked with making medicines according to doctor's prescriptions. Advances in pharmacology not only had a positive impact on public health, but also increased the status of medicine as a respected discipline (Abdel-Wahab et al., 2025; Swedberg et al., 2025; X. Wang et al., 2025).

Thus, the contribution of the medical world during the Abbasid era had a significant impact on the development of modern medical science. The support of the Abbasid government for knowledge, the establishment of the bimaristan, and the contributions of scientists such as Al-Razi and Ibn Sina, laid a strong foundation for the development of medicine later on.

During the Umayyad period, the translation of scholarly books from other languages into Arabic also began in order to spread the message of Islam. It was during the Umayyad period that the translation movement began, reaching a very rapid development during the Abbasid period. The first person to undertake translation work was Caliph Khalid bin Yazid (Death 84 H) (Azzahro, 2024).

Then, their influence even spread to Europe, where their works were translated into Latin and became references in European universities for centuries. This shows that the development of medicine during the Abbasid era not only left a legacy for the Islamic world, but also for the Western world as a whole. The following are some of the major achievements in the field of health and medicine during the Abbasid era, including:

Hospitals and Health Services

The Abbasids are also known for the establishment of Bimaristan (hospitals), which were one of the great innovations in the history of medicine. Unlike previous institutions, Bimaristans were designed as general hospitals open to all levels of society, regardless of religion or social status. These hospitals were equipped with a variety of facilities, including operating rooms, pharmacies, and specialist clinics. Some Bimaristans also served as centers for medical education, where medical students learned directly from senior doctors and practiced. One of the most famous hospitals of the period was Bimaristan Adudi in Baghdad, which was founded in the 10th century by Caliph Adud al-Dawla (Death 983AD). This hospital was equipped with advanced facilities for its time, and maintained high standards of cleanliness (Abdel-Wahab et al., 2025; Asl et al., 2025; Dahmardeh, 2025).

Pharmacy and Medicines

Pharmacists such as Ibn al-Baytar, a botanist and pharmacologist who compiled important works on the use of herbs and natural medicines. In addition, Abbasid hospitals also have well-organized pharmacies, where medicines are prepared and distributed scientifically. Saydalani Pharmacists developed the art of mixing medicines from natural ingredients such as plants, minerals, and animals. They created standardized methods of medicine, developed

different types of pharmaceutical preparations, including pills, ointments, and syrups. Advances in pharmaceutical science and medicine were also developed by the scientist Ibn Sina. In the book authored by him entitled "al-Qanun fi al-tibb", it is about the manufacture of simple and traditional medicines. The medicinal ingredients come from medicinal plants such as garlic, pepper, lemon, cinnamon and ginger as well as several other medicinal plants. Not only plants, but medicines can also come from animals such as honey, deer antlers, pearls, musk and several other useful animals (Asl et al., 2025; R. Wang et al., 2025; X. Wang et al., 2025).

Surgery

Al Zahrawi (Abulcasis) Compiled an encyclopedia of medicine and surgery that was used in the Western world for centuries. He introduced many surgical techniques and surgical instruments that were ahead of their time.

Medical Theory

Ibn Sina wrote the book al-Qanun fi al-Tibb (The Canon of Medicine), which became the standard reference in medicine throughout the world until the 17th century. This book covers various aspects of medicine, including diagnosis, treatment, diseases, and pharmacology, and combines Greek, Persian, and Indian knowledge with insights gained through direct observation.

Influential Figures on Medical Science and Health

The Abbasid period gave birth to many medical figures whose works became important references for centuries, both in the Islamic world and in Europe (Al-Attas, 1993). Some of them are:

Ar-Razi (Rhazes) (Robi'aqolbi, 2020)

A Persian physician and philosopher who is famous for his work in the field of Health. Medical science Ar-Razi, or Rhazes, is one of the leading figures in the history of Islamic medicine. Born around 865 AD in Persia (now Iran), Ar-Razi is known as a physician, alchemist, and philosopher. His most famous work is "al-Hawi" a medical encyclopedia that summarizes the medical knowledge of his time. Ar-Razi's Major Contributions in Medical Science:

Al-Hawi: This work is a complete description covering various diseases, diagnosis, and treatment. Ar-Razi compiled the essence of al-Hawi systematically and completely. In his book, al-Razi criticized the Greek philosophers, Aristotle and Plato and developed innovative ideas on many subjects. He also criticized Galen on the theory of fever because many cases he encountered did not match Galen's description of fever. He also criticized Galen on how to distinguish one disease from another that was not by urine but using the humoral system in his book al-Shukuk Ala Jalinus (Doubts on Galen) (Chandran et al., 2025; Grolli et al., 2025; Li et al., 2025)**Observation and Experimentation:** Ar-Razi is known for his observation and experimentation-based approach. He emphasized the importance of direct observation of patients and not just relying on theory. **Classification of Diseases:** He developed a system of classification of diseases, which helped him in diagnosis and treatment. Ar-Razi distinguished between different types of diseases, including infectious and chronic diseases. **Use of Medicine:** In "Al-Hawi", Ar-Razi lists various herbs and medicines used to treat diseases. He also developed techniques for extracting medicines from plants and natural substances. **Medical Ethics:** Ar-Razi emphasized the importance of ethics in medical practice. He believed that doctors should have empathy and care for the welfare of patients.

Influence: Al-Razi's work and thoughts were very influential in the Islamic world and Europe. He is considered one of the founders of modern medicine and many references to his work were made in European universities during the Middle Ages.

Ibn Sina (Avicenna)

The history of health records one of the Islamic figures who played a role in the science of medicine is Ibn Sina (980 AD - 1037 AD), who has written several books on methods of collecting and storing medicinal plants and how to make medicinal preparations such as pills, suppositories, syrups and develop medical knowledge from various countries to produce better treatment (Hakim, et al., 2021). His work *al-Qanun fi al-tibb* (Canon of Medicine), became the main reference book in medical science until the 17th century in Europe. This book discusses various aspects of medicine, including anatomy, physiology, and pharmacology, and provides explanations for the diagnosis and treatment of various diseases, and combines Greek, Persian, and Indian knowledge with insights gained through direct observation (Ding, 2025; Gudzak et al., 2025; Hoverd et al., 2025).

Al-Zahrawi (Abulcasis)

Compiled an encyclopedia of medicine and surgery that was used in the Western world for centuries. He introduced many surgical techniques and surgical instruments that were ahead of their time. **Al-Zahrawi's Major Contributions to Surgery: Surgical Innovations:** Al-Zahrawi introduced a variety of surgical techniques that are still relevant today. He developed methods for surgery, including techniques for treating wounds, cysts, and fractures (Ahmad, 2007). **Surgical Instruments:** He designed and described many surgical instruments, some of which were tools for suturing, removing kidney stones, and treating wounds. Some of these instruments became the basis for modern surgical tools. This shows that Abbasid scientists had modern knowledge. **Medical Education:** Through his work, Al-Zahrawi educated the next generation of physicians. He provided detailed explanations of surgical and medical procedures, including the importance of cleanliness and preventing infection. **Diseases and Therapies:** Al-Zahrawi discusses various diseases and therapies used at that time, and emphasizes the importance of proper diagnosis. **Cultural Context:** His works also reflect advances in science and technology during the heyday of Islam, where science was highly valued and developed rapidly.

CONCLUSION

From the discussion of the development of science and health during the Abbasid Dynasty, it can be concluded that the Abbasid Dynasty experienced very rapid development of science and health. The Abbasid Dynasty became a center of science, encouraging translations, and the development of scientific works. There were significant advances in various fields, including astronomy, mathematics, and philosophy. In the field of health and medicine, the Abbasid era witnessed advances in medical science with the establishment of hospitals and medical schools. Figures such as ar-Razi and ibn Sina contributed greatly through research and writing influential medical works.
